To select a Tone of another bank, you have to send Bank select(mm,II) before sending the Program change.

GS Common Exclusive messages use Model ID = 42H and Device ID = 17(10H).

#### ■ Request data 1 RQ1

This message is sent out to request the remote device to send back the required data.  
It contains data for the address and size that specify designation and length, respectively.  
On receiving a proper RQ1 message for the device, the device will transmit a "Data set 1 (DT1)" message, which contains the requested data. Otherwise, the device will not send anything.

### **- System Exclusive Message -**

#### **■ Data Transfer**

RA-95 transmits "Data set 1 (DT1)" message when receiving a proper "Request Data 1(RQ1)" message. Refer to section1(System Exclusive Message)

#### **■ Data set 1 DT1(12H)**

Status	Data Byte	Status
F0H	41H, 10H, (42H), 12H, aaH, bbH, ccH, ddH, ... eeH, sum	F7H
Byte	Description	
F0H	Exclusive status	
41H	Manufacturer's ID	(Roland)
10H	Device ID	(dev => 10H)
42H	Model ID	(GS)
12H	Command ID	(DT1)
aaH	Address MSB	
bbH	Address	
ccH	Address LSB	
ddH	Data	
:	:	
eeH	Data	
sum	Checksum	
F7H	EOX	(End of exclusive)

\* RA-95 only send the DT1 messages whose address and size match the Parameter Address Map (Section 3).

\* If the data to send is a large data (more than 128 bytes), then the data will be sent out in separate packets.

\* Refer to Section 4 to calculate a Checksum.

### **3 Parameter address map (Model ID=42H)**

This map indicates address, size, Data (range), Parameter, Description, and Default Value of parameters which can be transferred using "Request data 1 (RQ1)" and "Data set 1 (DT1)".

All the numbers of address, size, Data, and Default Value are indicated in 7-bit Hexadecimal-form.

#### **■ Individual parameter**

You can use individual parameter communication to send or request an individual parameter value.

One packet of System Exclusive messages "F0 .... F7" can only have one parameter (which may contain several bytes).

You cannot use any address having "#" for the top address in a System Exclusive message.

#### **■ System Parameters**

#### **■ Patch Parameters**

RA-95 has 16 parts. The parameters of each part are called PATCH PARAMETERS.

To send or request a PATCH PARAMETER, use not the part number (which is usually same as the MIDI channel number) but the BLOCK NUMBER in the message.

## 4 Useful Information

### ■ Decimal and Hexadecimal

It is common to use 7-bit Hexadecimal numbers in MIDI communication.  
The following is a conversion table between decimal numbers and 7-bit Hexadecimal numbers.

Decimal	Hexa-decimal	Decimal	Hexa-decimal	Decimal	Hexa-decimal	Decimal	Hexa-decimal
0	00H	32	20H	64	40H	96	60H
1	01H	33	21H	65	41H	97	61H
2	02H	34	22H	66	42H	98	62H
3	03H	35	23H	67	43H	99	63H

24	18H	56	38H	88	58H	120	78H
25	19H	57	39H	89	59H	121	79H
26	1AH	58	3AH	90	5AH	122	7AH
27	1BH	59	3BH	91	5BH	123	7BH
28	1CH	60	3CH	92	5CH	124	7CH
29	1DH	61	3DH	93	5DH	125	7DH
30	1EH	62	3EH	94	5EH	126	7EH
31	1FH	63	3FH	95	5FH	127	7FH

\*To indicate a decimal number for the MIDI channel, Bank number, and Program number, add one to the values in the table.

\*The resolution of 7-bit Hexadecimal numbers is 128. Use several bytes for values which require more resolution.

i.e. The number "ad bbH" in 7-bit Hexadecimal is "ad x 128 + bb" in Decimal form.

\*A signed number (with a sign +/-) is indicated as 00H = -64, 40H = %0, 7FH = +63.

So the signed number "aaH" in 7-bit Hexadecimal is "ad - 64" (ad is the decimal number of aaH).

In case of two bytes, it is regarded as 00 00H = -8192, 40 00H = %0, 7F 7FH = +8191.

So the signed number "ad bbH" in 7-bit Hexadecimal is "ad bbH - 40 00H = ad x 128 + bb - 64 x 128", where, ad and bb is the decimal number of aaH and bbH respectively.

\*The data indicated as "nibbled" is a 4-bit Hexadecimal number.

i.e. "0a 0bH" is "a x 16 + b".

<Example 1> Convert "5AH" in Hexadecimal to a Decimal number.  
(By using the table) 5AH = 90

<Example 2> Convert "12 34H" in 7-bit Hexadecimal to a Decimal number.  
(By using the table) 12H = 18, 34H = 52  
So,  $18 \times 128 + 52 = 2356$

<Example 3> Convert "0A 03 09 0D" in nibblized form to a Decimal number.  
(By using the table) 0AH = 10, 03H = 3, 09H = 9, 0DH = 13  
So,  $((10 \times 16 + 3) \times 16 + 9) \times 16 + 13 = 41885$

### ■ Example of actual MIDI messages

<Example 1> 92 3E 5F  
"9n" is a status of a Note On message, and "n" is a MIDI channel number.

The second byte is the Note number, and the third is Velocity.

2H = 2, 3EH = 62, 5FH = 95

So, this is a Note On message of MIDI channel=3, Note number=62(D4) and Velocity=95.

<Example 2> CE 49

"Cn" is a status of a Program change message, and "n" is a MIDI channel number.  
The second byte is a Program number.

EH = 14, 49H = 73

So, this is a Program change message of MIDI channel=15, Program number= 74 (Flute in GS).

<Example 3> EA 00 28

"EnH" is a status of a Pitch bend change message, and "n" is a MIDI channel number.  
The second byte (00H) is an LSB and the third (28H) is an MSB of a Pitch bend value (%signed).

The Pitch bend value is:

$28\ 00H - 40\ 00H = 40 \times 128 + 0 - (64 \times 128 + 0) = 5120 - 8192 = -3072$

So, this is a Pitch bend change message of MIDI channel=11, Pitch bend value = -3072

If the Pitch bend sensitivity is set to 2 semitones, and the Pitch bend value -8192 (00 00H) is defined as -200 cents.

The actual pitch bend value of this message is:  
 $200 \times (-3072) \% (-8192) = -75$  cent

<Example 4> B3 64 00 65 00 06 0C 26 00 64 7F 65 7F

"Bn" is a status of a Control change message, and "n" is a MIDI channel number.  
The second byte is a Control number and the third is the value.  
This packet uses the running status rule, that is, when you send a series of messages with the same status, you can omit the following status bytes.

This message contains :

B3	64	00	MIDI CH = 4	LSB of RPN parameter number : 00H
(B3)	65	00	MIDI CH = 4	MSB of RPN parameter number : 00H
(B3)	06	0C	MIDI CH = 4	MSB of Data entry : 0CH
(B3)	26	00	MIDI CH = 4	LSB of Data entry : 00H
(B3)	64	7F	MIDI CH = 4	LSB of RPN parameter number : 7FH
(B3)	65	7F	MIDI CH = 4	MSB of RPN parameter number : 7FH

This message string means 'send data "0C 00H" to RPN parameter number"00 00H", after that, set RPN parameter number to "7F 7F"'.

RPN parameter number "00 00H" is Pitch bend sensitivity and the unit of the MSB value is a semitone, so 0CH = 12 is a value  
to set the Pitch bend sensitivity = 12 semitones (one octave).

GS devices ignore the LSB value of Pitch bend sensitivity. However, you had better send both MSB and LSB(=00H) to maintain data compatibility.

Once an RPN or NRPN number is set, all the Data entry messages sent after are effective.

Sometimes this rule may cause a problem if the MIDI data is played by a recorder and it is operated in fast forward or backward made. It is recommended, therefore, to set the RPN or NRPN number to 7F 7FH after sending the Data entry messages.

\*To use running-status for several MIDI event like <example 4> in a song data (e.g. Standard MIDI File data) is not recommended.

There may be a recorder which can not handle such data correctly when it is operated in fast forward or backward. Putting the status byte for every event is the reliable way.

\*The parameter number and the value of RPN or NRPN must be sent in correct order. As some recorders may send those recorded data in different order if an event is too close to another, it is recommended to place each event in a different tick. (1-CLK for TPQN=92, or 5-CLK for TPQN=480 is recommended.)

The send order may be different as each recorder if the events are in the same clock in sequence data.

### Checksum of Roland System Exclusive messages

Roland System Exclusive messages (RQ1 and DT1) have a Checksum at the end of the data (just before EOX) to be able to check for communication errors.

The Checksum is determined by values of address and data (or size) included in the message.

<How to calculate Checksums> ("H" indicates Hexadecimal.)

The error checking process employs a sum-check error detection. It provides binary bit figures whose lower 7 bits are zero when values for an address, data (or size) and the Checksum are summed.

One practical equation to determine Checksum is:

If the address is "ad bb ccH" and the data( or the size) is "dd ee ffH"  
ad + bb + cc + dd + ee + ff = sum  
sum % 128 = quotient % remainder  
128 - remainder = checksum

<Example 1> Set "REVERB MACRO" to "ROOM 3"

According to the Parameter Address Map, the Address of REVERB MACRO is 40 01 30H, and the Value correspond to ROOM 3 is 02H.  
So, the message should be :

F0 41 10 42 12 40 01 30 02 ?? F7(1)Exclusive Status (4)Model ID (GS)  
(2)ID (Roland) (5)Command ID (DT1)  
(1)(2)(3) (4) (5) address data checksum (6) (3)Device ID (16) (6)End of Exclusive

The Checksum is :  
 $40H + 01H + 30H + 02H = 64 + 1 + 48 + 2 = 115(\text{sum})$   
 $115(\text{sum}) \% 128 = 0(\text{quotient}) \% 115(\text{remainder})$   
checksum =  $128 - 115(\text{remainder}) = 13 = 0DH$

Therefore, the message to send is : F0 41 10 42 12 40 01 30 02 0D F7

<Example 2> To request LEVEL of NOTE NUMBER 75(D#5; Claves) in DRUM MAP 1

NOTE NUMBER 75(D#5) is 4BH in Hexadecimal.  
The Address of "LEVEL of NOTE NUMBER 75(D#5; Claves) in DRUM MAP 1" is 41 02 4BH, and the size is 00 00 01H. So, the message should be :

F0 41 10 42 11 41 02 4B 00 00 01 ?? F7 (1)Exclusive Status (4)Model ID (GS)  
(2)ID (Roland) (5)Command ID (RQ1)  
(1)(2)(3) (4) (5) address size checksum (6) (3)Device ID (16) (6)End of Exclusive

The Checksum is :  
 $41H + 02H + 4BH + 00H + 00H + 01H = 65 + 2 + 75 + 0 + 0 + 1 = 143(\text{sum})$   
 $143(\text{sum}) \% 128 = 1(\text{quotient}) \% 15(\text{remainder})$   
checksum =  $128 - 15(\text{remainder}) = 113 = 71H$

Therefore, the message to send is : F0 41 10 42 11 41 02 4B 00 00 01 71 F7

<Example 3> Set "MASTER TUNE" to +23.4 cents by System Exclusive  
The Address of "MASTER TUNE" is 40 00 00H, and the Size is 00 00 04H.  
The Value should be nibblized data whose resolution is 0.1 cents, and which is a signed value  
( 00 04 00 00H (= 1024) = %60 ).  
+23.4[cents] = 234 + 1024 = 1258 = (hexadecimal)=> 04 EAH =(nibblized)=> 00 0E 0AH  
So, the message should be :

F0 41 10 42 12 41 00 00 00 04 0E 0A ?? F7 (1)Exclusive Status (4)Model ID (GS)  
(2)ID (Roland) (5)Command ID (DT1)  
(1)(2)(3) (4) (5) address data checksum (6) (3)Device ID (16) (6)End of Exclusive

The Checksum is :  
 $41H + 00H + 00H + 00H + 04H + 0EH + 0AH = 65 + 0 + 0 + 0 + 4 + 14 + 10 = 93(\text{sum})$   
 $93(\text{sum}) \% 128 = 0(\text{quotient}) \% 93(\text{remainder})$   
checksum =  $128 - 93(\text{remainder}) = 35 = 23H$

Therefore, the message to send is : F0 41 10 42 11 41 00 00 00 04 0E 0A 23 F7

##### ■ Note off

Status	Second	Third
8nH	kkH	vvH
9nH	kkH	00H

n=MIDI channel number: 0H - FH (ch.1 - ch.16)  
 kk=Note number: 00H - 7FH (0 - 127)  
 vv=Velocity: 00H - 7FH (0 - 127)

- \* Ignored when "Rx.Note message = OFF".
- \* In the drum part, recognized when "Rx.Note off = ON" for each instrument.
- \* Velocity is ignored.

##### ■ Note on

Status	Second	Third

kk= source note number for pitch reference: 00H - 7FH (0 - 127)

\* When a Note On message is received after a Portamento Control message, the voice's pitch will glide from the pitch specified by the source note number of the Portamento Control message at the rate set by the portamento time controller (regardless portamento on/off.) If there is a currently sounding voice whose note number is coincident with the source note number, the voice's pitch will glide to the new Note On's pitch according to the portamento time without re-triggering (played in legato). Then no new voice should be assigned.

#### **\*\*NRPN\*\***

An NRPN (Non Registered Parameter Number) is an expanded control change message.

Each function of an NRPN is described by the individual manufacturer.  
To use NRPN, set NRPN number (MSB/LSB) before sending data. Then send data by Data entry message(Control Change # 6/38).  
And then, it is recommended to send RPN null (RPN number = 7FH/7FH) to prevent the data from being unexpectedly change. For more explanation, refer to Chapter 4. Useful Information, Example of actual MIDI messages <EXAMPLE 4>.

You can change the following parameters by using NRPN.

NRPN MSB LSB	Data entry MSB	Description
01H 08H	mmH	Vibrato rate relative change on specified channel mm: 0EH - 40H - 72H (-50 - 0 - +50)

1AH rrH	mmH	TVA level of drum instrument absolute change on specified drum instrument rr: key number of drum instrument mm: 00H - 7FH (zero - maximum)

1CH rrH	mmH	Panpot of drum instrument absolute change on specified drum instrument rr: key number of drum instrument mm: 00H, 01H - 40H - 7FH (Random, Left-Center-Right)

#### \*\*RPN\*\*

An RPN (Registered Parameter Number) is an expanded control change message.

Each function of an RPN is described by the MIDI Standard.

To use RPN, set RPN number (MSB/LSB) before sending data. Then send data by Data entry message(Control Change # 6/38). And then, it is recommended to send RPN null (RPN number = 7FH/7FH) to prevent the data from being unexpectedly change. For more explanation, refer to Chapter 4. ## - System Realtime Message -

### ■ Active sensing

Status
FEH

- \* Having received an "active sensing" message, RA-95 expects to receive additional active sensing messages at 300ms intervals.  
If the interval is greater than 420ms, RA-95 executes "All sounds off", "All notes off" and "Reset all controllers" and returns to normal operation. (Monitoring of active sensing messages will terminate.)

### ■ Sequencer start

Status
FAH

When "Sequencer start" is received the internal recorder starts.

### ■ Sequencer stop

Status
FCH

When "Sequencer stop" is received the internal recorder and/or the internal arranger stop.

### ■ Timing clock

Status
F8H

When "Timing clock" is received the internal recorder is synchronized with an external clock.

note: This message is received when the parameter "Midi Rx Mode" is "MIDI2" or "AUTO2" if the Midi File Player is in Play and when the parameter "Midi Rx Mode" is not "Internal" if the Midi File Player is in Record.

## ■ System Exclusive Messages of Mode Change

System Exclusive Messages of Mode Change are the messages used to initialize the internal parameters of the device to General MIDI mode or GS default mode. "GS reset" and "Exit GS mode" use a form of Roland Exclusive Message. "Turn General MIDI System On" and "Turn General MIDI System Off" use a form of Universal Non-real Time Message.

## ■ Data Transfer

RA-95 can transmit and receive the various parameters using System Exclusive messages of the following data format.  
GS Common Exclusive messages use Model ID = 42H and Device ID = 17(10H).  
RA-95 have a unique Exclusive communication function which has its own Model IDs in addition to the GS Common Exclusive messages.

## ■ Request data 1 RQ1

This message is sent out to request the remote device to send back the required data. It contains data for the address and size that specify designation and length, respectively. On receiving a proper RQ1 message for the device, the device will transmit a "Data set 1 (DT1)" message, which contains the requested data. Otherwise, the device will not send anything.

\* If the data to send is a large data (more than 128 bytes), then the data will be sent out in separate packets.

\* Refer to Section 4 to calculate a Checksum.

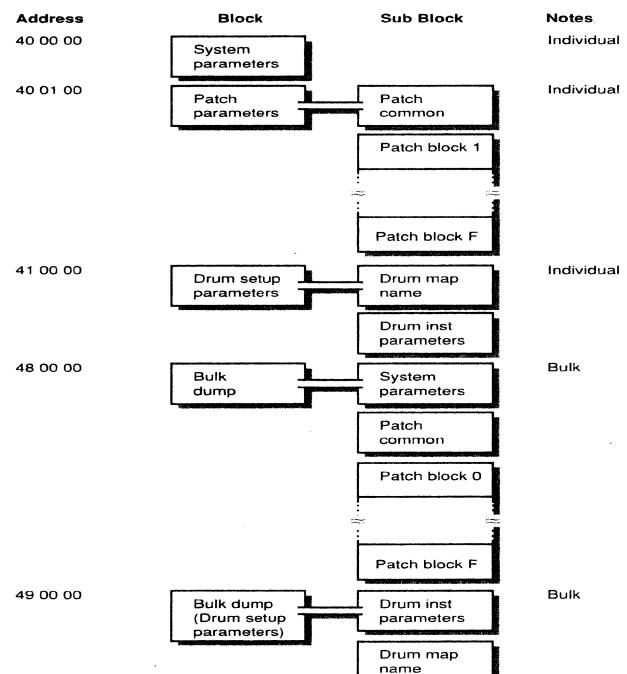

## 3 Parameter address map (Model ID=42H)

This map indicates address, size, Data (range), Parameter, Description, and Default Value of parameters which can be transferred using "Request data 1 (RQ1)" and "Data set 1 (DT1)".

All the numbers of address, size, Data, and Default Value are indicated in 7-bit Hexadecimal-form.

### ■ Address Block map

An outlined address map of the Exclusive Communication is shown below;

There are two types of GS Exclusive message. One is an individual parameter communication, the other is a bulk dump communication.

### ■ Individual parameter

You can use individual parameter communication to send or request an individual parameter value.

One packet of System Exclusive messages "F0 .... F7" can only have one parameter (which may contain several bytes).

You cannot use any address having "#" for the top address in a System Exclusive message.

### ■ Patch Parameters

RA-95 has 16 parts. The parameters of each part are called PATCH PARAMETERS. To send or request a PATCH PARAMETER, use not the part number (which is usually same as the MIDI channel number) but the BLOCK NUMBER in the message.

*x...BLOCK NUMBER (0 - F),	Part 1 (default MIDIch = 1) x=1
	Part 2 (default MIDIch = 2) x=2

The sum total of voices in the voice reserve function must be equal or less than the number of the maximum polyphony. The the number of the maximum polyphony of RA-95 is 28.

For the compatibility to other GS models, it is recommended to be equal or less than 24.

## ■ Bulk Dump

You can send or request bulk data which contains a large amount of parameter data by using Bulk Dump communication.

It is used for storing bulk data in a sequencer or a computer.

To send or request bulk data, use the Address and Size indicated in the following map.

You cannot use any address having "#" for the top address in a System Exclusive message except the following case.

Messages which include large data (more than 128 bytes) are sent out in separate packets, then, the top address of the following messages may be the address marked "#".

To send several packets of large DT1 messages at a time, insert intervals of at least 40ms in between those packets.

## 4 Useful Information

### ■ Decimal and Hexadecimal

It is common to use 7-bit Hexadecimal numbers in MIDI communication. The following is a conversion table between decimal numbers and 7-bit Hexadecimal numbers.

Decimal	Hexa-decimal	Decimal	Hexa-decimal	Decimal	Hexa-decimal	Decimal	Hexa-decimal
0	00H	32	20H	64	40H	96	60H
1	01H	33	21H	65	41H	97	61H
2	02H	34	22H	66	42H	98	62H
3	03H	35	23H	67	43H	99	63H
4	04H	36	24H	68	44H	100	64H
5	05H	37	25H	69	45H	101	65H
6	06H	38	26H	70	46H	102	66H
7	07H	39	27H	71	47H	103	67H
8	08H	40	28H	72	48H	104	68H
9	09H	41	29H	73	49H	105	69H
10	0AH	42	2AH	74	4AH	106	6AH
11	0BH	43	2BH	75	4BH	107	6BH
12	0CH	44	2CH	76	4CH	108	6CH
13	0DH	45	2DH	77	4DH	109	6DH
14	0EH	46	2EH	78	4EH	110	6EH
15	0FH	47	2FH	79	4FH	111	6FH
16	10H	48	30H	80	50H	112	70H
17	11H	49	31H	81	51H	113	71H
18	12H	50	32H	82	52H	114	72H
19	13H	51	33H	83	53H	115	73H
20	14H	52	34H	84	54H	116	74H
21	15H	53	35H	85	55H	117	75H
22	16H	54	36H	86	56H	118	76H
23	17H	55	37H	87	57H	119	77H
24	18H	56	38H	88	58H	120	78H
25	19H	57	39H	89	59H	121	79H
26	1AH	58	3AH	90	5AH	122	7AH
27	1BH	59	3BH	91	5BH	123	7BH
28	1CH	60	3CH	92	5CH	124	7CH
29	1DH	61	3DH	93	5DH	125	7DH
30	1EH	62	3EH	94	5EH	126	7EH
31	1FH	63	3FH	95	5FH	127	7FH

\*To indicate a decimal number for the MIDI channel, Bank number, and Program number, add one to the values in the table.

\*The resolution of 7-bit Hexadecimal numbers is 128. Use several bytes for values which require more resolution.

i.e. The number "ad bbH" in 7-bit Hexadecimal is "ad x 128 + bb" in Decimal form. A signed number (with a sign +/-) is indicated as 00H = -64, 40H = %0, 7FH = +63.

So the signed number "aaH" in 7-bit Hexadecimal is "ad - 64" (ad is the decimal number of aaH).

In case of two bytes, it is regarded as 00 00H = -8192, 40 00H = %0, 7F 7FH = +8191.

So the signed number "ad bbH" in 7-bit Hexadecimal is "ad bbH - 40 00H = ad x 128 + bb - 64 x 128", where, ad and bb is the decimal number of aaH and bbH respectively.

\*The data indicated as "nibbled" is a 4-bit Hexadecimal number.  
i.e. "0a 0bH" is "a x 16 + b".

<Example 1> Convert "5AH" in Hexadecimal to a Decimal number.  
(By using the table) 5AH = 90

<Example 2> Convert "12 34H" in 7-bit Hexadecimal to a Decimal number.  
(By using the table) 12H = 18, 34H = 52  
So,  $18 \times 128 + 52 = 2356$

<Example 3> Convert "0A 03 09 0D" in nibbled form to a Decimal number.  
(By using the table) 0AH = 10, 03H = 3, 09H = 9, 0DH = 13  
So,  $((10 \times 16 + 3) \times 16 + 9) \times 16 + 13 = 41885$

### ■ Example of actual MIDI messages

<Example 1> 92 3E 5F  
"9n" is a status of a Note On message, and "n" is a MIDI channel number.  
The second byte is the Note number, and the third is Velocity.  
2H = 2, 3EH = 62, 5FH = 95  
So, this is a Note On message of MIDI channel=3, Note number=62(D4) and Velocity=95.

<Example 2> CE 49

"Cn" is a status of a Program change message, and "n" is a MIDI channel number.  
The second byte is a Program number.  
EH = 14, 49H = 73  
So, this is a Program change message of MIDI channel=15, Program number= 74 (Flute in GS).

<Example 3> EA 00 28

"EnH" is a status of a Pitch bend change message, and "n" is a MIDI channel number.  
The second byte (00H) is an LSB and the third (28H) is an MSB of a Pitch bend value (%signed).

The Pitch bend value is:

$28\ 00H - 40\ 00H = 40 \times 128 + 0 - (64 \times 128 + 0) = 5120 - 8192 = -3072$   
So, this is a Pitch bend change message of MIDI channel=11, Pitch bend value = -3072

If the Pitch bend sensitivity is set to 2 semitones, and the Pitch bend value -8192 (00 00H) is defined as -200 cents.

The actual pitch bend value of this message is :  
 $200 \times (-3072) \% (-8192) = -75$  cent

<Example 4> B3 64 00 65 00 06 0C 26 00 64 7F 65 7F

"Bn" is a status of a Control change message, and "n" is a MIDI channel number.  
The second byte is a Control number and the third is the value.  
This packet uses the running status rule, that is, when you send a series of messages with the same status, you can omit the following status bytes.

This message contains :

B3 64 00	MIDI CH = 4	LSB of RPN parameter number	: 00H
(B3) 65 00	MIDI CH = 4	MSB of RPN parameter number	: 00H
(B3) 06 0C	MIDI CH = 4	MSB of Data entry	: 0CH
(B3) 26 00	MIDI CH = 4	LSB of Data entry	: 00H
(B3) 64 7F	MIDI CH = 4	LSB of RPN parameter number	: 7FH
(B3) 65 7F	MIDI CH = 4	MSB of RPN parameter number	: 7FH

This message string means 'send data "0C 00H" to RPN parameter number"00 00H", after that, set RPN parameter number to "7F 7F".

RPN parameter number "00 00H" is Pitch bend sensitivity and the unit of the MSB value is a semitone, so 0CH = 12 is a value  
to set the Pitch bend sensitivity = 12 semitones (one octave).

GS devices ignore the LSB value of Pitch bend sensitivity. However, you had better send both MSB and LSB(=00H) to maintain data compatibility.

Once an RPN or NRPN number is set, all the Data entry messages sent after are effective.

Sometimes this rule may cause a problem if the MIDI data is played by a recorder and it is operated in fast forward or backward mode. It is recommended, therefore, to set the RPN or NRPN number to 7F 7FH after sending the Data entry messages.

\*To use running-status for several MIDI event like <example 4> in a song data (e.g. Standard MIDI File data) is not recommended.

There may be a recorder which can not handle such data correctly when it is operated in fast forward or backward. Putting the status byte for every event is the reliable way.

\*The parameter number and the value of RPN or NRPN must be sent in correct order. As some recorders may send those recorded data in different order if an event is too close to another, it is recommended to place each event in a different tick. (1-CLK for TPQN=92, or 5-CLK for TPQN=480 is recommended.)

The send order may be different as each recorder if the events are in the same clock in sequence data.

### Checksum of Roland System Exclusive messages

Roland System Exclusive messages (RQ1 and DT1) have a Checksum at the end of the data (just before EOX) to be able to check for communication errors.

The Checksum is determined by values of address and data (or size) included in the message.

<How to calculate Checksums> ("H" indicates Hexadecimal.)

The error checking process employs a sum-check error detection. It provides binary bit figures whose lower 7 bits are zero when values for an address, data (or size) and the Checksum are summed.

One practical equation to determine Checksum is:

If the address is "ad bb ccH" and the data( or the size) is "dd ee ffH"  
ad + bb + cc + dd + ee + ff = sum  
sum % 128 = quotient % remainder  
128 - remainder = checksum

<Example 1> Set "REVERB MACRO" to "ROOM 3"

According to the Parameter Address Map, the Address of REVERB MACRO is 40 01 30H, and the Value correspond to ROOM 3 is 02H.  
So, the message should be :

F0 41 10 42 12 40 01 30 02 ?? F7 (1)Exclusive Status (4)Model ID (GS)  
(2)ID (Roland) (5)Command ID (DT1)  
(1)(2)(3) (4) (5) address data checksum (6) (3)Device ID (16) (6)End of Exclusive

The Checksum is :  
 $40H + 01H + 30H + 02H = 64 + 1 + 48 + 2 = 115(\text{sum})$   
 $115(\text{sum}) \% 128 = 0(\text{quotient}) \% 115(\text{remainder})$   
checksum =  $128 - 115(\text{remainder}) = 13 = 0DH$

Therefore, the message to send is : F0 41 10 42 12 40 01 30 02 0D F7

<Example 2> To request LEVEL of NOTE NUMBER 75(D#5; Claves) in DRUM MAP 1

NOTE NUMBER 75(D#5) is 4BH in Hexadecimal.  
The Address of "LEVEL of NOTE NUMBER 75(D#5; Claves) in DRUM MAP 1" is 41 02 4BH, and the size is 00 00 01H. So, the message should be :

F0 41 10 42 11 41 02 4B 00 00 01 ?? F7 (1)Exclusive Status (4)Model ID (GS)  
(2)ID (Roland) (5)Command ID (RQ1)  
(1)(2)(3) (4) (5) address size checksum (6) (3)Device ID (16) (6)End of Exclusive

The Checksum is :  
 $41H + 02H + 4BH + 00H + 00H + 01H = 65 + 2 + 75 + 0 + 0 + 1 = 143(\text{sum})$   
 $143(\text{sum}) \% 128 = 1(\text{quotient}) \% 15(\text{remainder})$   
checksum =  $128 - 15(\text{remainder}) = 113 = 71H$

Therefore, the message to send is : F0 41 10 42 11 41 02 4B 00 00 01 71 F7

<Example 3> Set "MASTER TUNE" to +23.4 cents by System Exclusive  
The Address of "MASTER TUNE" is 40 00 00H, and the Size is 00 00 04H.  
The Value should be nibblized data whose resolution is 0.1 cents, and which is a signed value  
( 00 04 00 00H (= 1024) = %0 ).  
+23.4[cents] = 234 + 1024 = 1258 =(hexadecimal)=> 04 EAH =(nibblized)=> 00 04 0E 0AH  
So, the message should be :

F0 41 10 42 12 41 00 00 00 04 0E 0A ?? F7 (1)Exclusive Status (4)Model ID (GS)  
(2)ID (Roland) (5)Command ID (DT1)  
(1)(2)(3) (4) (5) address data checksum (6) (3)Device ID (16) (6)End of Exclusive

The Checksum is :  
 $41H + 00H + 00H + 00H + 04H + 0EH + 0AH = 65 + 0 + 0 + 0 + 4 + 14 + 10 = 93(\text{sum})$   
 $93(\text{sum}) \% 128 = 0(\text{quotient}) \% 93(\text{remainder})$   
checksum =  $128 - 93(\text{remainder}) = 35 = 23H$

Therefore, the message to send is : F0 41 10 42 11 41 00 00 00 04 0E 0A 23 F7
